

# Laparoscopic Surgery

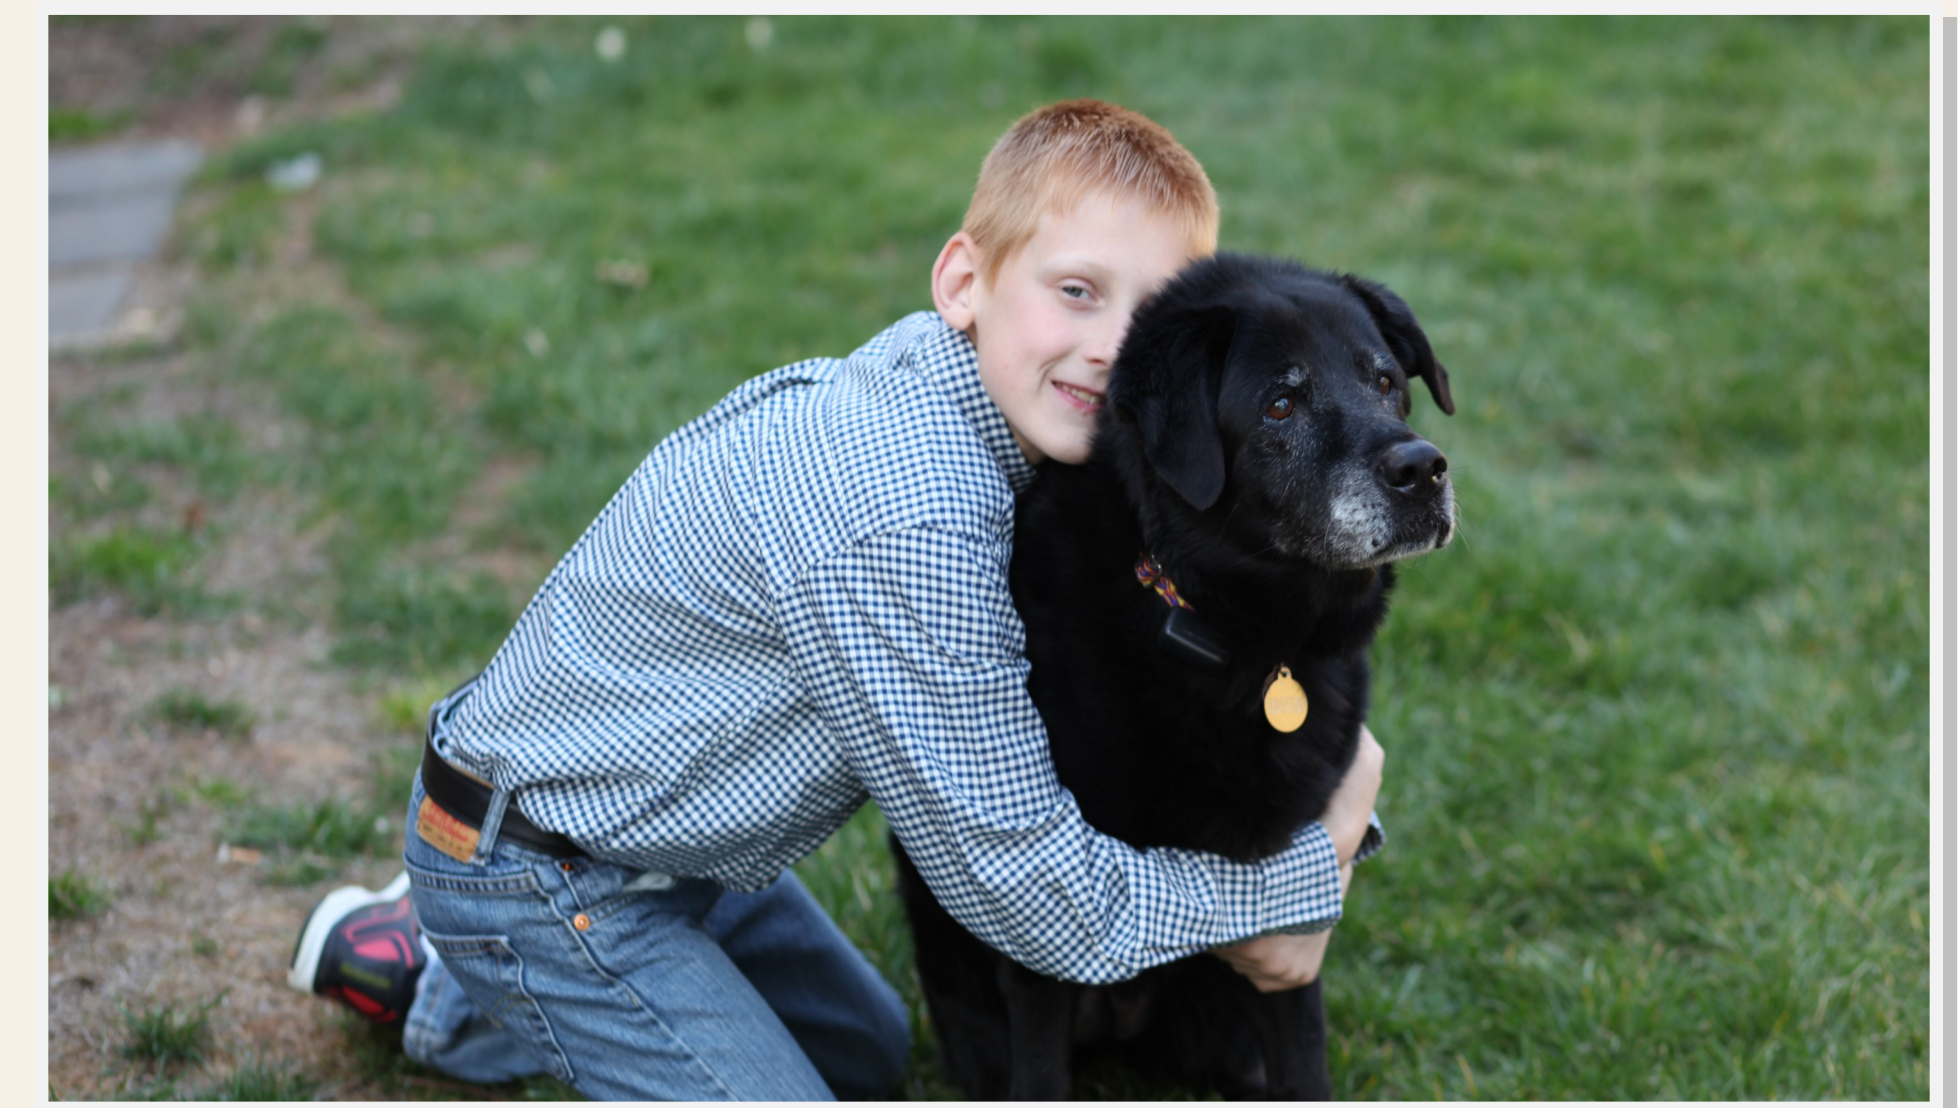

Laparoscopic surgery is a minimally invasive surgical technique used in both humans and animals. A 5mm surgical telescope is inserted through a small keyhole sized incision. This camera allows surgeons to view magnified organs on a monitor. Additional small incisions are made to facilitate the use of surgical instruments, and surgeons can perform a more precise, less painful surgery, avoiding the traditional large incisions.

## Advantages of Laparoscopic Surgery

- Smaller incisions in your animal
- Less pain and bruising
- Faster recovery
- Less blood loss
- Quicker return to normal activity
- Allows for same-day return home
- Excellent visualization of organs
- Less scarring

**You can also view videos of the procedure on YouTube under “lap spay.”**

## Common Applications

- Diagnostic Laparoscopy
- Laparoscopic Spay
- Ear — Video Otoscopy for ear cleaning
- Bladder Stones
- Nose — Nasal Exam and Biopsy
- Laparoscopic Gastropexy for GDV or Bloat
- Soft Palate Resection

This approach is safer and less painful; providing faster healing and quicker return to normal activity than traditional open procedures. We perform these procedures in our operating room. In most situations your pet is able to return home the same day as the procedure.

## Quail Corners Animal Hospital

Please take a brochure describing minimally invasive surgery or visit our website:
